

The way most people review down equipment is to scan through a map in a computer program (not shown). The equipment under one’s ownership is scattered across the factory floor. This makes review time consuming and prone to error.

Each individual tool (equipment) can be found on an intranet website. The script pulls every tool table under my purview and combines them.

Zooming in on just one tool. One can see that the tool is in an unscheduled PM in the Reason column, and the most recent comments indicate that is failed particles. This stands out as a issue to look further into.
